1. INTRODUCTION

The current technology shows that a few changes in learning styles and access educational resources. The learning methods are moving from physical to the online platforms that provide flexibility and convenience for users. This project focuses on developing an E-Learning System that enables students to access learning materials, submit assignments, and track their academic progress through a centralized platform.

An information system is used in various sectors such as education, healthcare, banking and business to improve quality and decision-making processes. In the education sector, information systems play an important role in managing learning activities, student records, and academic performance. The combination of hardware, software and people that work together allow to share an information and process it.

E-Learning platforms use information systems to deliver course notes, create an assessment and track student progress in real time. By using an information system, educational institutions can provide more flexible, accessible, and efficient learning experiences for students.

The organization that are using this system is an educational service provider that focus on delivering the online learning methods to students. Students can improve their knowledge and skills when the organization improves the way to access learning materials.

To support its operations, the organization requires a reliable E-Learning System that can manage users, courses, learning materials, and assessments efficiently. The system allows lecturers to upload course content, and assignments, and evaluate student performance. At the same time, administrators manage user accounts and monitor system activities to ensure smooth operation. This system helps the organization enhance learning quality and improve overall user experience.

2. SYSTEM OBJECTIVE

An E-Learning System called MyStudyZone, is an online educational platform that enables students and lecturers to continue the learning process anywhere on any device when physical classes are not possible to establish. It functions as a centralized system, web-based client-server system where all learning data and activities are managed in a central server, allows users to access it through web browser and operates by interaction between clients (users) and server. A students can access course materials, assignments, while lecturers can organize and maintain student records. Hence, we are developing this online student election system to achieve the objective below:

- **To develop a centralized E-Learning System**

Create a system that combines learning materials, assignments in a single platform improving accessibility and management for both students and lecturers.

- **To provide multiple access materials for learning**

Allow students to access notes from multiple lecturers and courses without needs to manual sharing methods, to reduce time on finding notes.

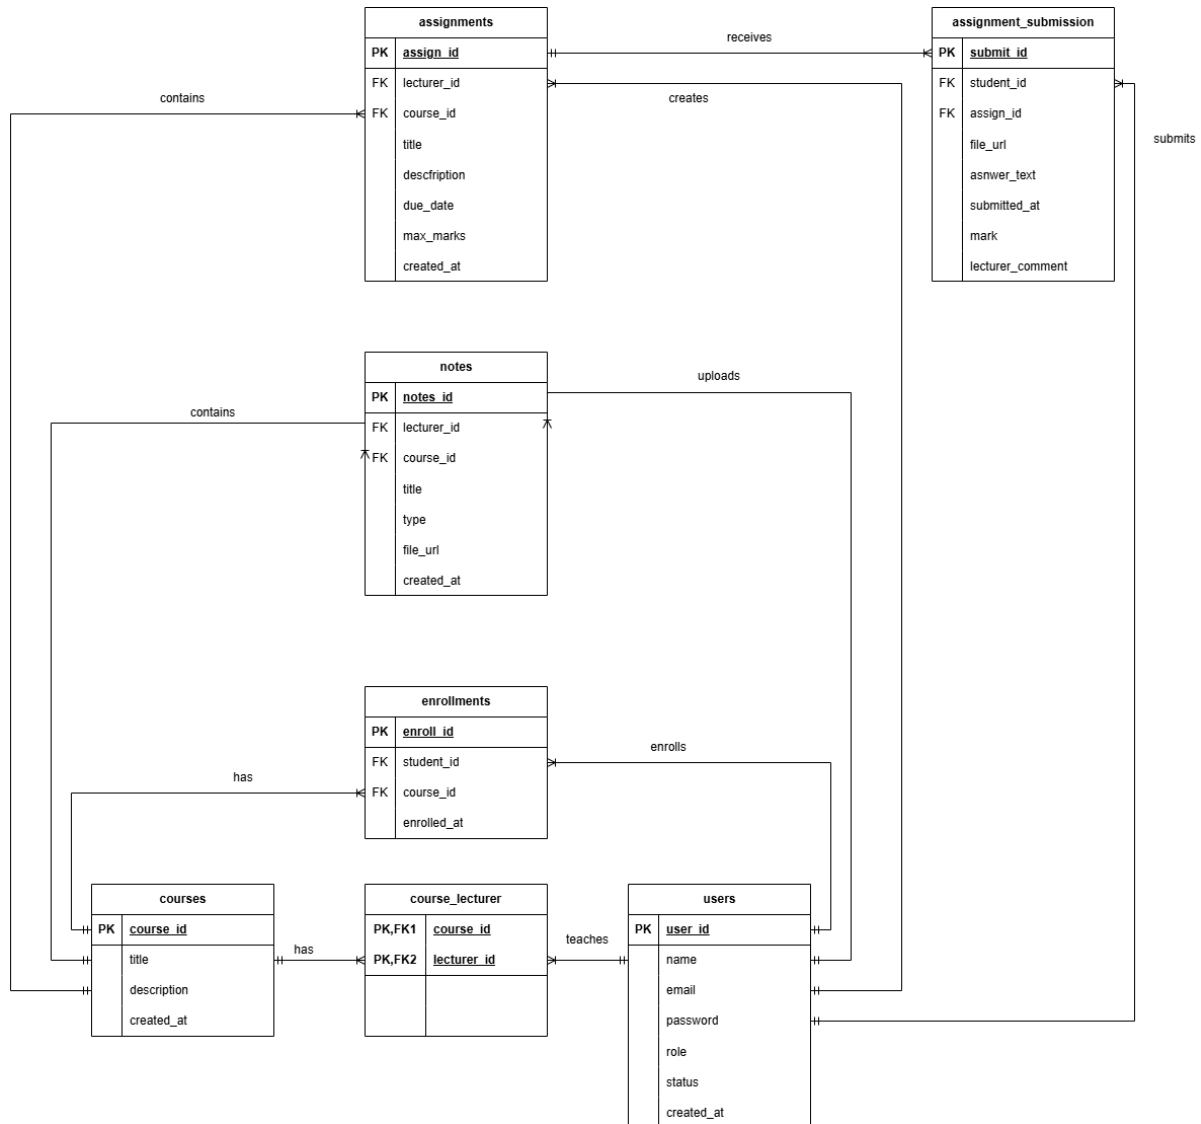

- **To support the flexible learning environment**

Enabling lecturers to upload materials, and interact with students online, ensuring continuity of learning even when physical classes cannot be held.

3. ENTITY RELATIONSHIP DIAGRAM

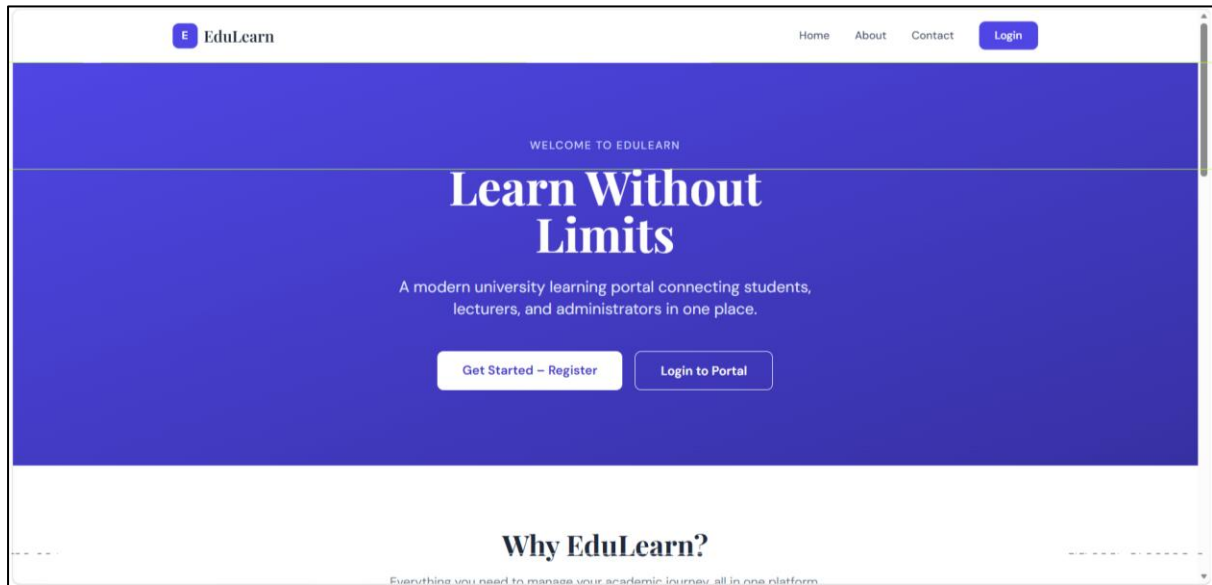

https://drive.google.com/file/d/1_L_RSRJ37PLr5QeGgrZsrdDeUZgSG_Iv/view?usp=sharing

An ERD is a visual representation of the system's data and relationships between different entities. It helps to identify the structure of the database, showing how entities such as Student, Lecturer, Admin interact with one another.

Users

The Users management page allows administrators to view and manage the system's user base. It features a filter bar for 'All', 'Students', and 'Lecturers', a search bar, and an 'Add user' button. The main table lists users with columns for Name, Email, Role, Status, and Joined date. Each user entry includes a unique ID and an action button to either deactivate or activate the account.

5. FLOW OF E-LEARNING SYSTEM

1. Student Module

Courses

- Read: View enrolled courses.

Notes

- Read: Access and download learning materials uploaded by lecturers.

Assignments

- Create: Submit assignment.
- Read: View assignment details and submission status.
- Update: Resubmit assignment before deadline.
- Delete: Remove submission before deadline (optional).

Results

- Read: View grades and academic performance.

2. Lecturer Module

Courses

- Create: Create course information.
- Read: View course details.
- Update: Edit course information.
- Delete: Remove course.

Notes

- Create: Upload learning materials.
- Read: View uploaded materials.
- Update: Modify notes.
- Delete: Remove notes.

Assignments

- Create: Create assignments.

- Read: View assignments.
- Update: Edit assignment details.
- Delete: Remove assignments.

Submissions

- Read: View student submissions.
- Update: Grade and provide feedback to students.

3. Administrator Module

Users

- Create: Register student and lecturer accounts.
- Read: View user information.
- Update: Edit user details.
- Delete: Remove user accounts.

Courses

- Create: Add courses.
- Read: View course records.
- Update: Modify course information.
- Delete: Remove courses.

System Monitoring

- Read: Monitor system activities and reports
